

STOCKFLOW

StockFlow User Manual

Warehouse inventory and location dispatch system

Purpose

Use StockFlow to track products, dispatch supplies to company locations, record returns, and review every warehouse movement.

Audience

Warehouse managers
System administrators
Operations managers

Version 1.0 | September 2026

This manual describes the current online application. It does not include prices, sales, customer payments, employee collection, or barcode hardware.

Contents

Section	What you will learn
1 Getting started	Sign in, navigation, roles, and safe operation
2 Dispatch stock	Select products, destination, quantities, and receipt
3 Manage products	Add, edit, add stock, deactivate, and inspect history
4 Return stock	Return items against an original location dispatch
5 Transactions	Read and filter the permanent movement ledger
6 End of Day	Review everything sent out on a selected date
7 Locations	Add destinations such as MTN and Wesley Towers
8 Dashboard	Monitor balances and items needing attention
9 Users and security	Manage access, passwords, and logout
10 Troubleshooting	Resolve common operating errors

How StockFlow works

StockFlow records company-owned supplies moving into and out of the warehouse. A warehouse manager receives a request from a destination, builds a dispatch in the app, selects the location, and confirms the issue. The server validates stock, reduces all quantities together, and writes a permanent transaction record.

Action	Inventory effect	Accountability record
Dispatch	Quantity decreases	Location, products, officer, date and time
Add stock	Quantity increases	Supplier, reference, officer, date and time
Return	Quantity increases	Location, original dispatch, officer, date and time
Deactivate product	No quantity change	Product remains in historical records

1 Getting started

Sign in

1. Open the secure StockFlow web address supplied by your administrator.
2. Enter your work email address and password.
3. Use the eye icon if you need to check the password you entered.
4. Select Sign in. StockFlow opens on Dispatch.

Never share a password or save it on a public device. If sign-in repeatedly fails, stop and contact an administrator rather than guessing.

Navigation

Menu	Purpose
Dispatch	Prepare supplies for delivery to a location.
Products	Manage the catalogue and add stock.
End of Day	Review dispatches for a selected date.
Dashboard	See inventory totals and attention items.
Returns	Restore returned supplies to stock.
Transactions	Review the permanent movement history.
Locations	Manage delivery destinations.
Users	Admin-only account management.
Settings	Change your own password.

Mobile navigation

On a phone or tablet, select the menu button in the top-left corner. Choose a section from the vertical drawer. The drawer closes after selection.

Roles

Role	Typical access
Administrator	All operations, products, locations, users, settings, and history.
Warehouse officer	Dispatch, add stock, returns, inventory, and transaction history.
Manager	Read-focused dashboard, balances, movements, and daily review.

2 Dispatch stock

Use Dispatch when supplies leave the warehouse for a company location. Do not use it for damaged stock corrections or informal notes.

Create a dispatch

1. Open Dispatch from the sidebar.
2. Search for a product or browse the product cards.
3. Select the plus button on each requested product. Select it again to add another unit.
4. Review the Supply cart on the right. Use plus or minus to change quantities, or the bin icon to remove a line.
5. Choose the Delivery location. The location card confirms the organization and address when available.
6. Select Print collection receipt if a paper copy should travel with the driver.
7. Review the total units and select DISPATCH Complete issue.
8. Wait for the success message and transaction ID before handing supplies to the driver.

What happens after confirmation

- Every product is checked for sufficient available stock.
- The entire dispatch succeeds or fails together. Stock cannot be partly deducted.
- Inventory is reduced on the server.
- One transaction ID connects every product line in the dispatch.
- The destination, warehouse officer, date, and time are recorded.
- Low-stock or out-of-stock alerts update automatically.

Printed dispatch receipt

The receipt includes the transaction ID, destination location, organization, delivery address when recorded, product quantities, and transaction time. Print it only after the dispatch succeeds.

Before the vehicle leaves

- Match physical quantities to the on-screen cart.
- Confirm the selected location.
- Keep the receipt with the load if printing was selected.
- Do not click the completion button twice. Check Transactions if confirmation is uncertain.

3 Manage products

Open a product

Open Products and select a product card. The details window shows current quantity, unit, category, minimum level, status, and recent movements.

Add a new product

1. Open Products.
2. Select Add product.
3. Enter a unique SKU, product name, category, unit, opening quantity, minimum level, and optional maximum level or cost.
4. Select the save button and confirm that the product appears in Products and Dispatch.

Add stock to an existing product

1. Open Products and select the product.
2. Select Add stock.
3. Enter the supplier, reference number when available, quantity, and notes.
4. Confirm the transaction.
5. Verify the new balance and transaction entry.

Edit product details

1. Open the product details.
2. Select Edit item details.
3. Update the allowed fields, including unit or stock thresholds.
4. Save changes and verify the product card.

Deactivate a product

Deactivate products that should no longer be dispatched. Deactivation removes the product from active dispatch choices but does not delete prior transactions. This protects the audit trail.

Stock status

Status	Rule	Action
In stock	Quantity is above the minimum level.	No action required.
Low stock	Quantity is at or below the minimum and above zero.	Arrange replenishment.
Out of stock	Quantity is zero.	Add stock before dispatching.

4 Return stock

Use Returns when previously dispatched supplies physically come back from a location. The return must be connected to the original dispatch whenever possible.

Record a return

1. Open Returns.
2. Select Start a return.
3. Choose the location returning the items.
4. Choose the original issue transaction.
5. Select each returned product and enter the actual quantity received.
6. Add notes for condition, damage, or delivery context when useful.
7. Review the lines and select Record stock return.
8. Confirm the stock balance increased and the return appears in Recent returns.

Return controls

- A return cannot exceed the quantity still returnable from the original dispatch.
- Only products on the selected dispatch can be returned against it.
- Returned stock is added only after the full transaction succeeds.
- Every returned line receives an immutable stock-movement record.

If returned items are damaged and should not re-enter usable inventory, do not record them as a normal return. Ask an administrator to use the approved adjustment process.

5 Transactions

Transactions is the permanent stock movement ledger. It contains stock issued, stock added, stock returned, and authorized adjustments.

1. Open Transactions.
2. Set From and To dates if you need a specific period.
3. Review the movement type, product, quantity, destination or reference, officer, and timestamp.
4. Select a transaction row to open its details.

Historical transactions are not deleted. If an operational mistake is found, report it to an administrator so it can be corrected with an authorized movement rather than by changing history.

6 End of Day

End of Day answers what left the warehouse on a selected date. It is a dispatch review, not a financial close.

Complete the daily review

1. Open End of Day.
2. Confirm the selected date.
3. Review the number of dispatches, product lines, and total units.
4. Check every transaction ID, destination, product, and quantity against dispatch paperwork or driver handover records.
5. Open Transactions if a line needs more detail.
6. Report discrepancies before the next operating day.

Measure	Meaning
Dispatches	Number of unique completed issue transactions.
Product lines	Number of individual products across those dispatches.
Total units	Sum of all quantities dispatched on that date.

7 Locations

Locations are the destinations that receive stock, such as MTN or Wesley Towers. Dispatches are assigned to locations, not employees.

Add a location

1. Open Locations.
2. Select Add location.
3. Enter the location name and a unique location code.

4. Choose the parent organization.
5. Add the delivery address when available.
6. Select Add location and confirm it appears in the list and Dispatch dropdown.

Use specific names when an organization has several destinations, for example MTN Head Office and MTN Kumasi Office.

8 Dashboard

The Dashboard summarizes product count, units in stock, items needing attention, delivery locations, recent movements, and frequently issued supplies. Use it to spot problems, then open the relevant operational screen to act.

9 Users and security

User administration

Users is available to administrators. Create a separate account for each authorized person and assign the least powerful role that supports their work. Deactivate accounts that should no longer access StockFlow.

Change your password

1. Open Settings.
2. Enter the current password.
3. Enter and confirm the new strong password.
4. Submit the change.
5. Sign out and sign back in if requested.

Sign out

Select Log out at the bottom of the sidebar whenever you finish work, especially on shared warehouse devices.

Security practices

- Use only the HTTPS production address.
- Never share accounts or passwords.
- Confirm the signed-in name before processing stock.
- Do not leave an authenticated device unattended.
- Report unexpected transactions immediately.

10 Troubleshooting

Message or symptom	What to do
Only X units are available	Reduce the cart quantity or add stock to the product before dispatching.
Item is out of stock	Open Products, verify the physical count, and use Add stock only for a real receipt.
Location is missing	Ask an administrator to add or activate the destination in Locations.
No original issue for return	Confirm the location and verify that the item was dispatched through StockFlow.
Return exceeds issue	Reduce the quantity to the amount still eligible for return.
No permission	Ask an administrator to confirm your role. Do not use another person's account.
Connection interrupted	Do not resubmit immediately. Check Transactions first to see whether the transaction completed.
Receipt did not print	Check Transactions for success, reopen the relevant record if available, then print once.

Daily warehouse checklist

When	Check
Start of day	Sign in with your own account. Review Dashboard and items needing attention.
Each dispatch	Match physical items, cart quantities, and destination before confirmation.
Each stock addition	Confirm delivered quantities, supplier, and reference before saving.
Each return	Count items and connect them to the original location dispatch.
End of day	Review End of Day totals and compare them with vehicle and handover records.
Before leaving	Resolve discrepancies, secure printed receipts, and log out.

Support information

When requesting help, provide the transaction ID, product name, destination location, date and time, and the exact message shown. Never send your password.
